Q	Q
---	---

Human chorionic gonadotropin (hCG) is a glycoprotein hormone secreted by the developing embryo during pregnancy. It is a member of the glycoprotein hormone family, which also includes luteinizing hormone (LH), follicle-stimulating hormone (FSH), and thyroid-stimulating hormone (TSH). hCG is produced by the syncytiotrophoblast cells of the placenta and is used as a marker for pregnancy. It is also used in the treatment of certain types of cancer, such as testicular cancer and choriocarcinoma, because it can stimulate the production of testosterone and other hormones. hCG is also used in the treatment of infertility, as it can stimulate the release of an egg from the ovary. The structure of hCG is a dimer of two subunits, α and β , which are linked by disulfide bonds. The α subunit is identical to the α subunit of LH, FSH, and TSH, while the β subunit is unique to hCG. The β subunit contains a specific sequence of amino acids that is responsible for its biological activity.
